# **Low Current Draw 1 Channel Loop Detector**

9416-010

This "Self-tuning" loop detector is specifically designed for DoorKing **Solar Powered** 6524 and 9024 gate operators but will work on other DoorKing gate operators (**Not** for use on 4302 **solar powered** control box operators, 6003, 6004, 6005 & 6400). It controls an **individual loop** (including 2 series wired reversing loops configuration). The loop detector plugs into loop detector ports on the gate operator control board. This "Self-tuning" detector will constantly monitor the loop's frequency status and "Self-tune" for any minor deviations with the frequencies to keep the loop operating normally and decrease "false calls". The detector also employs several automatic and advanced features that will assist technicians in the field with trouble shooting loop problems. Refer to the **Loop Information Manual** located at **www.tech.dooorking.com** for information on installing in-ground loops.

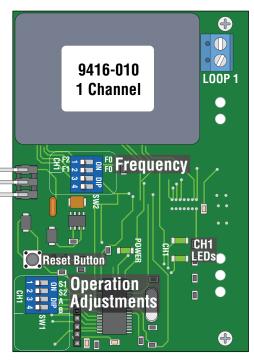

# **Frequency DIP-Switches**

When the detector is powered up, or when the reset button is pressed, the detector will blink out the frequency that the loop has tuned to (in KHz) on the CH1 LEDs. For example, CH1 blinks five times - pause - blinks six times indicates that the Loop has tuned to 56 KHz. This automatic frequency measurement is useful in applications for two or more loops that are in close proximity to each other.

DIP SW 2	Switch 1 CH1 F2	Switch 2 CH1 F1	Switch 3 & 4	
High	OFF	OFF	Mattlead	
Med-High	OFF	ON	Not Used	
Med-Low	ON	OFF	Leave OFF	
Low	ON	ON		

A common problem with loops are when they are positioned too close to each other and their detection fields overlap. If the loops are on similar frequencies, this can cause "cross-talk" between the loops and "false calls" can

occur in the loop detectors. Knowing what frequency each loop has tuned to allows you to adjust the frequencies of each loop. Keep the frequencies as far apart from each other as possible and the loop with the longest length of wire should be set to the lowest frequency. Switching the frequency of a loop **WILL NOT** affect any of the operation adjustments or the over all detecting height of the loop.

# **Operation Adjustments DIP-Switches**

Turn On Fast-Trak	DIP SW 1	Adjust Loop Sensitivity		Turn On Sensitivity Boost
Switch 1 (S1)		Switch 2 (S2)	Switch 3 (A)	Switch 4 (B)
Normal- <b>OFF</b> Fast-Trak- <b>ON</b>	Low	OFF	OFF	Æ
	Med-Low	OFF	ON	al-0F -0N
	Med-High	ON	OFF	Normal- Boost- <b>0</b>
	High	ON	ON	No Bo

## **Loop Sensitivity**

Adjusts how much moving metal must be present in the loop detection field before the loop detector will send an output.

#### **Sensitivity Boost**

Once the detector senses a vehicle, this feature increases the loop detector's sensitivity to compensate for a higher section of that vehicle (usually a truck trailer or truck bed) that the detector may not completely sense, and allow the vehicle to pass completely over the loop before closing the gate. This prevents the loop detector from "losing detection" on a higher part of a vehicle and start the closing cycle before the vehicle has cleared the loop. This feature can be individually turned **ON** for each loop but **WILL NOT** increase a loop's over all detecting height.

# **Fast-Trak**

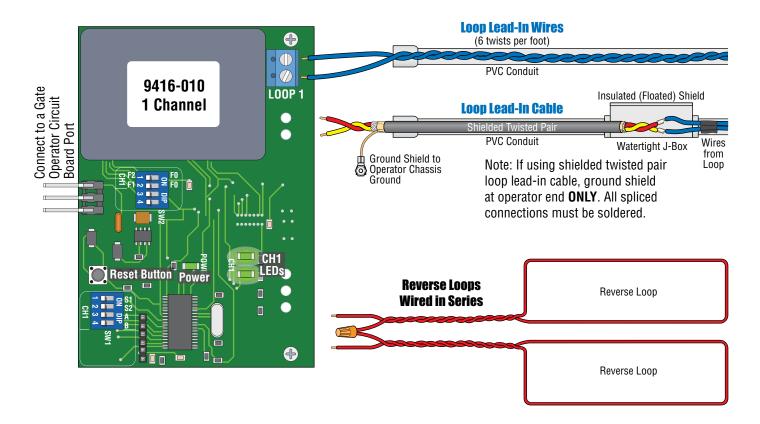

Fast-Trak is useful on a degraded loop that may drift in frequency over a period of time. An indication of this would be when the detector has an excessive amount of "false calls". This is usually caused by poor quality wire in the loop itself, a poor wire connec-

tion in the loop system or wire insulation damage. It usually fails when the loop gets wet but will work OK when the moisture is gone. When Fast-Trak is turned ON, it will allow the loop's frequency to drift more than normal and not give the excessive "false calls". **Caution** should be exercised when using the Fast-Trak feature. If excessive frequency drift continues (indicated by an excessive amount of "false calls" with Fast-Trak turned ON), the loop itself will have to be replaced.

ORKING 120 S. Glasgow Avenue

Inglewood, California 90301 U.S.A.

## Loop 1 (CH1) Terminal

Connect the loop lead-in wires or cable to terminal. Ground loop lead-in cable to operator chassis ground if used.

# **Reset Button**

Pressing the reset button clears faults and resets the detector.

## **Power LED**

Illuminates when detector has acceptable power.

#### CH1 LEDs

Illuminates when loop detector senses a vehicle in the Loop's detection field. It will also indicate the Loop's frequency when the detector is powered up or when a physical problem exists in the loop itself.

## **Loop Monitoring with CH1 LEDs**

The loop detector constantly monitors the frequency of the loop to determine if the frequency is too high or too low, or if the loop system has a physical problem. When this happens, the detector will "Lock On" and the CH1 LEDs will steadily flash when the loop has a problem. If the frequency of the loop returns to nominal levels, the detector will resume normal operation but CH1 LEDs will continue to flash. Steadily flashing CH1 LEDs are an indication that a physical problem exist in the loop system itself and that the loop will probably have to be replaced. The CH1 LEDs can be reset by pressing the reset button.
