

## ISN-GMA-S6 Fixing Device

Use with an ISN-SM Series Seismic Detector to monitor safes and strong-rooms against attack from thermic and mechanical tools, and unauthorized opening while the system is armed.

The fixing device consists of a detector plate, door plate, and quiescent plate made of peraluman.

The detector plate has a monitoring micro switch and a magnet contact in line. There is a mounting space for a test transmitter.

The door plate has an opening for the surveillance of a keyhole. When the system is armed, the monitoring switch inside the detector plate closes. If the detector raises from the door plate, the monitoring switch opens and activates an alarm.

During working hours, you can hang detector plate on the quiescent plate. Weighs 0.40 kg (14 oz).

### Ordering Information

#### ISN-GMA-S6 Fixing Device

Works with a seismic detector to monitor safes and strong-rooms. Includes a detector plate, door plate, and quiescent plate.
