

CELLULAR COMMUNICATION A BETTER OPTION

TG-7FS PROTECTION

- Traditional landlines are more costly than cellular communication.
- Traditional landlines are becoming less and less reliable.
- Telguard's TG-7FS can reduce cost and improve reliability as part of any commercial fire application.
- AHJs and Fire Marshals across the country approve the TG-7FS.
- Telguard's TG-7FS is made in the USA.

Landlines are Increasingly Less Reliable

Are you relying on plain old telephone service (POTS) lines for your fire systems? There is now a better, more reliable and more cost-effective solution available for your fire system. Current NFPA 72 standards state that if a traditional telephone line is used as the primary means of communication, the secondary path must be an alternate method. You can elect to use the TG-7FS as a backup to the POTS line or consider eliminating the costly landline altogether and use the TG-7FS LTE cellular communicator as the sole path of communication.

Do You Really Know Your Landline Provider?

It is becoming more apparent that as landlines degrade, carriers are opting to avoid costly repairs leaving many without traditional landline service. Upgrade to Telguard's TG-7FS to ensure delivery of critical information to your monitoring station. Sole path cellular technology offers more frequent and consistent supervision of the fire system communication path.

Compatible with Virtually any Fire System

Telguard's TG-7FS LTE cellular communicators are designed to work with existing fire panels. There is no need to replace the entire system to cost effectively complete an upgrade of your system communications.

CELLULAR COMMUNICATION A BETTER OPTION

Decision makers have been trusting Telguard communicators for decades to complete fire systems.

Why? Because cellular communication is a better option.

Replacing aging landline technology with a more current and reliable LTE cellular solution can better protect your property and save money.
